Manual Association Tab:

- Utility designed to bring in mass amounts of yield / as-applied / as-planted / other data.
- Indicate the grower under which the data will reside, choose an upload configuration, set the data date / crop, browse to find a zipped folder with the data and upload.
- The system will go through a process that sends the data out to be converted and then brought back in.
- Once loaded back into I.F.A.R.M., the data segments will appear in a window. Users can see the amount of data points for each segment.
- Select & render the data in the map tab.
- Several options are available to associate data to fields.
- Associate all yield to the list of fields, or push data into fields one at a time.
- Upon uploading, the data will appear under the field in the tree.
- Users can then use the data editors to clean the yield / as-applied data.
